Japanese Encephalitis (JE) ²								JE1				JE2		
Influenza ³						← Two doses for the initial vaccination, followed by one dose annually. →								
Hepatitis A (HepA) ⁴									HepA1			HepA2		
Diphtheria and tetanus toxoids with acellular pertussis and inactivated polio (DTaP-IPV)													DTaP-IPV	

1.Beginning in 2016, the BCG immunization schedule has been shifted from 24 hours to 5 months after birth (the recommended vaccination window is between 5 and 8 months after birth).

2.The Japanese encephalitis vaccine, live attenuated (Chimeric virus) (JE-CV_LiveAtd vaccine) began to be administered on May 22, 2017. First dose administered at 15 months, followed by a 12-week interval before the second dose.

- 3.Children younger than 8 years old should receive two doses of influenza vaccine in the first immunization, with a four-week interval between doses. For children aged 9 and older, only one dose of vaccine is required for the initial vaccination. When children are gathered for vaccination on campus, the current policy stipulates that one dose of a government-funded vaccine will be administered. Four weeks after the initial dose, parents may have a second dose administered at their expense to their 8-year-old or younger children if they deem it to be necessary.
- 4.Beginning in January 2018, hepatitis A vaccination targets will include infants born after January 1, 2017 and older than 12 months. Preschoolers with household registration in 30 mountainous townships, 9 plain townships close to neighboring mountainous townships, and Kinmen County and Lianjiang County residents who have previously received government-funded hepatitis A vaccinations are also included. Furthermore, as of April 8, 2019, elementary school students in grades six and those from lower income families, as well as those from medium- and low-income families, are eligible for vaccination.Two doses for the initial vaccination, followed by one dose annually.
